Ribsam's Lawn Grass Seeds

The preparation for laying down lawn is too often hastily and imperfectly made. The first point is to get the ground shaped to the desired grade, taking care in grading that when the hills are removed sufficient subsoil is also removed, to be replaced with top soil, so that at least six inches of good soil will overlie the whole in all places. When the grading is finished, drains should be laid wherever necessary; then the whole should be thoroughly plowed, a subsoiler following it in the wake of the common plow, until it is completely pulverized. A heavy harrow should then be applied, until the surface is thoroughly fined down. All stones, roots, etc., should be removed, so that a smooth surface may be obtained. The lawn is now ready to be sown. When the seed is sown, a light harrow should again be applied, and after a thorough rolling given, so that the surface is made as smooth as possible. In the latitude of New Jersey the seed may be sown at any time during the months of April and May, and will form a good lawn by August if the preparation has been good. If sown in hot months of June or July, a sprinkling of oats should be sown at the same time, so that the shade given by the oats will protect the young grass from the sun. For small plots, of course, digging, trenching and raking must be done instead of plowing, subsoiling or harrowing. August and September are also good months to sow grass seed.

**QUANTITY OF LAWN GRASS SEED TO SOW**

One pound is sufficient to sow 200 square feet, 10x20 ft., seventy-five to one hundred pounds per acre are required for a rapid sward. If by mail, add seven cents per lb. for first pound and one cent for each additional pound thereafter.

**GRASS SEED** in separate kinds for Lawn, Pasture and Hay, see pages 34 and 35.

Ribsam's Lawn Fertilizer

It is far superior to lump, straw manure, which disfigures the lawn with filthy materials, giving off an offensive odor, and is less expensive than manure; the cost of the Dressing being less, in many cases, than the cost of applying stable manure. It is odorless, and is so clean that anyone can apply it. It contains no weed seeds found always in manure, and which are the pests of the lawn. This is so prepared that it acts gradually through the season, producing a luxurious growth of rich green of grass color. It may be applied at any time during the Spring or early Autumn, or as often as the grass seems to need nourishment. One pound to ten square feet, or 500 pounds to an acre. Price, 6c. per lb.; per bag of 10 lbs., 50c.; per 25 lbs., $1.00; per 100 lbs., $4.75; per ton, $55.00.

This is one of the best vegetables for Winter use, producing from the axils of the leaves an abundance of sprouts, resembling small cabbages, of excellent, mild flavor. It has never come into general use in this country, probably owing to its being too tender to stand the Winters of the Northern States; still, by sowing in April or May, and planting out in July, it may be had in fine condition until December, and in the Southern States may be had in use from November to March.

CABBAGE

GERMAN KRAUT, ITALIAN CAVOLA CAPUCCIO, POLISH KAPUSTA

One ounce will sow 75 feet of drill, and produce about 2000 plants.

The early varieties of Cabbage are cultivated more extensively than any other vegetable. In latitudes where the thermometer never indicates 20 degrees below the freezing point, seed may be sown in the open border in October, and planted out on the first opening of Spring, but in our Northern States they must either be sown in hot-beds in February, or, what is still better, wintered over in cold-frames. For this purpose the seed is sown from the tenth to twentieth of September. Attention to date is important; if too soon, the plants might run to seed, and if too late, they will be too small.

In four or five weeks from the time of sowing they will be fit to transplant into cold frames. In planting it is very important with Cabbage or Cauliflower that the plant is set down to the first leaf, so that the stem is all under ground, for if exposed, it will be split by the action of the frost, and will be injured in consequence. The plants are usually set out from the middle of March to the middle of April, in rows about two feet apart, and eighteen inches between the plants in rows. The late varieties are usually sown in the early part of May, and the plants are set out in July, at a distance of three feet between the rows and two feet between the plants.

One ounce will sow 75 feet of drill and produce 2000 plants.

Any soil that will grow Cabbage will grow Cauliflower, as their requirements are almost similar. But as the product is more valuable, extra manuring and preparation of the soil will be well repaid.

The seed may be sown in September and wintered over in the same manner as described for early cabbage. Where this is not practicable, it may be be nearly as well by sowing the seeds in the hot bed in January or February and transplanting the plants at two or three inches apart, in boxes, or in the soil of another hot-bed, until such time as they are safe to be planted in the open ground, which, in this latitude, is usually from the 15th of March to the 10th of April. If properly hardened off, they are seldom injured by planting out too early.

Sown at the same time and under the same conditions with ten other kinds, on the 1st of June, heads of the Early Snow-Ball measuring nine inches in diameter, are about one week earlier than any other sort. Besides this variety, every plant forms a fine head. In addition to its earliness and greater certainty to head than any other sort, its dwarf habit and short outer leaves allow it to be planted closer together, which is important for growing under glass during Winter and Spring, this variety is particularly well adapted. 25c. per pkt.; $2.00 per oz.; $6.00 per lb.; $20.00 per lb.

GERMAN SELERIE, ITALIAN SADAMA, POLISH SELERY

One ounce will sow 100 foot row, and produce 3000 plants.

Sow in open ground as soon as it is fit to work, late in March and of April. Keep clear of weeds until time for transplanting, in June or July. The tops should be thinned out once or twice before transplanting to insure stocky plants. When from four to six inches high, transplant into broad shallow trenches nearly on the level, three feet apart, and six inches in the rows. The soil should be light, highly manured and moist, or near water, as the plants must be freely watered in dry weather. Earthing up should not be begun until the plants are quite well grown; then earth up gradually, keeping the leaf-stocks close together, so that the earth may not fall into the center of the plant. Never earth up in wet weather, which is earthed or bunched up early is liable to rust. When severe cold weather comes on, cover with leaves, hay or straw, and place boards on the top to keep out moisture. The covering must be put on gradually, else there will be danger of heating and consequent decay.

It possesses a rich, nutty flavor, suffused with dainty pink, which not only delights the eye, but tempts the palate of the epicure. 10c. per pkt.; 45c per oz.; $1.00 per lb.; $5.50 per lb.

GOLDEN YELLOW SELF-BLANCHING—French Strain—This variety of Celery is of a yellowish green color, but as they mature the inner stems and leaves turn a beautiful golden yellow, which adds much to their attractiveness and makes the work of blanching much easier. The handsome color, crispness, tenderness, freedom from stringiness, and fine nutty flavor of this variety makes it only necessary to be tried in order to establish it as the standard of excellence as an early sort. 10c. per pkt.; 85c per oz.; $3.00 per lb.; $10.00 per lb.

GOLDEN SELF-BLANCING—"American Grown." A most valuable variety which partakes somewhat of the character of the celebrated White Plume, in as much as it does not require such high banking-up as the ordinary sort to be fit for the table. It simply needs a slight earthing-up or handling. It is a beautiful waxy, golden color, very solid, and of a rich, nutty flavor. 10c. per pkt.; 50c. per oz.; $1.50 per 1/2 lb.; $4.75 per lb.

EASY BLANCHING or EASY BLEACHER—EXTRA STRAIN—A tall-growing white variety of excellent quality, of recent introduction. Blanches readily with boards. Grows well both on muck and upland. The seed should be sown in hot-beds the second week in March, care being taken to protect the young plants from cold at night. Plant out about June 1st, about two and a half feet apart. If no hot-bed is at hand, sufficient plants may be raised for a small garden by sowing a few seeds in common flower pots or boxes in the house.

**Endive**

**GERMAN ENDIVIEN, ITALIAN ENDIVA, POLISH ENDYWIA**

One ounce will sow a 100-foot row. Endive is one of the best salads for Fall and Winter use. Sow for an early supply about the middle of April. As it is used mostly in the Fall months, the main sowings are made in June and July, from which plantations are formed one foot apart in each way, in August and September. It requires no special soil or manure, and after planting is kept clear of weeds until the plant has obtained its full size, when the process of blanching begins. This is effected by gathering up the leaves and tying them by their tips in a conical form with bass matting. This excludes the light and air from the inner leaves, which in the course of from three to six weeks, according to the temperature at the time, become blanched. Another and simpler method consists in covering up the plants as they grow with slate or boards, which serves the same purpose—by excluding the light—as the tying-up.

KALE OR BORECOLE
GERMAN BLATTERKOHL, ITALIAN CAVOLA VERDE, POLISH SOLANKA
One ounce will produce about 2000 plants.
Kale or borecole may be grown in almost any soil but the richer it is the more abundant the product. Sow from the middle of April to the beginning of May, in prepared beds, covering the seeds thinly and evenly; transplant in June, and treat in the same manner as for cabbage. Of all the cabbage tribe, this is the most tender and delicate, and would be much more extensively grown than it is if its excellent qualities were generally known. The varieties are all extremely hardy, and are best when touched by frost.

GREEN CURLED SCOTCH—A rather dwarf variety, growing about eighteen inches in height, but spreading under good cultivation to three feet in diameter. Leaves of a bright green beautifully curved. 10c. per pkt.; 15c. per oz.; 35c. per ½ lb.; $1.00 per lb.

LEEK
GERMAN LAUCH, ITALIAN PORRO, POLISH PONY
One ounce will sow a drill of about 100 feet.
The Leek is very hardy and easily cultivated. It succeeds best in light, but well enriched soil. Sow as early in Spring as practical in drills one inch deep and one foot apart. When six to eight inches high, they may be transplanted in rows ten inches apart each way, as deep as possible, that the neck being covered, may be blanched. If fine Leeks are desired, the ground can hardly be made too rich.

SIBERIAN CURLED—This variety grows a little larger and coarser than the preceding. The leaves are not so deeply curled, and are of a bluish-green color. Very hardy. 10c. per pkt.; 15c. per oz.; 35c. per ½ lb.; $1.00 per lb.

LETTUCE
GERMAN SALAD, ITALIAN LETTUGA, POLISH SALATA
One ounce will sow about 100-foot row.
The cultivation of Lettuce is universal by all who have gardens, and from its tractable nature and freedom from nearly all insects and disease, it is manageable in the hands of everyone. For main early crop, seed may be sown in the open ground, middle of September, and transplanted to cold-frames as soon as large enough to handle, being wintered over in the same manner as early Cabbage, in dry, well sheltered spots, by covering up with leaves or litter, late in the season. Lettuce plants may be saved over Winter, without glass covering, in southern parts of the country without difficulty. The plants for setting out in the Spring are also sown in cold-frames in

EARLY WHITE VIENNA—Flesh white and tender. The best market sort. Exceedingly fast. 10c. per pkt.; 20c. per oz.; 75c. per ½ lb.; $2.50 per lb.

LEAF
GERMAN KNOLLKOHL, ITALIAN CAROLO RAPA, POLISH KALAREPA
One ounce will produce about 2000 plants.
A vegetable intermediate between the Cabbage and the Turnip. It is best cultivated by sowing the seed in rows in April to July, according to the latitude. In this district we
February and in hot-beds in March, and by carefully covering up at nights, makes plants to set out in April; but these are never so good as those wintered over. For successive crops, sowings may be made in the open ground as early as Spring opens, until July.

The variety blanches itself naturally, is crisp, tender and of excellent flavor, and always free from bitterness. It is not a forcing variety, but is one of the best for Summer use ever introduced. 10c. per pkt.; 25c. per oz.; 75c. per 1/4 lb; $2.50 per lb.

**ROMAINE or PARIS WHITE COS**—Forms long, upright heads of narrow leaves, which are crisp and refreshing; withstands the summer heat. 10c. per pkt.; 20c. per oz.; 50c. per 1/4 lb; $1.50 per lb.

MUSHROOM SPAWN

GERMAN SCHWAMM, ITALIAN FLINGO PRALAGO, POLISH GRYZB

Ten pounds will spawn ten square feet.

Mushrooms may be cultivated much easier than is generally supposed. They can be grown in a cellar or shed or in beds prepared in the open air same as hot-beds. Take fresh horse manure, shake it well apart and lay it in a heap to ferment. turn and mix it well every three or four days by shaking the outside of the heap, which is cold, and the inside, which is hot, together, so that every part of it may be equally fermented and deprived of its noxious qualities. When the dung is in a fit state to be made into a bed, which will be from two to three weeks after it has been put together to ferment, select a dry spot for a foundation, mark out the bed, which should be four feet wide and as long as you may choose to make it. In forming the bed mix the dung well together, beating it down with a fork until from 18 to 24 inches thick. In this State it may remain until the temperature is sufficiently moderate for spawning, which may be ascertained by trial sticks thrust in different parts of the bed.

Divide the large cakes of Spawn into small lumps, plant them two inches below the surface and six inches apart, covering with two inches of fine, light soil, and press down evenly. When finished, cover the bed three inches thick with clean straw and protect from heavy rains. The mushrooms will make their appearance in from four to six weeks, according to the season. Special pamphlet furnished on application.

As early in Spring as the ground is in working order, commence operations by leveling the ground with a rake and read it firmly; sow thinly in drills about a quarter of an inch deep and one foot apart cover with fine soil and press down with the back of a spade or a light roller.

POTATO

8 to 12 bushels will plant an acre, according to the kind of machine used, also distances planted.

The Potato, like all robust-growing vegetables, can be grown with varying success on soils of all kinds and in all conditions of fertility, but the soil best suited to it is a sandy loam. In all heavy soils it is more subject to a disease, and the flavor is much inferior. In breaking up good pasture land, the decaying sods answer sufficiently well for the first year in lieu of manure. Manure is applied either in rows or hills, or broadcast over the ground, and plowed in—the latter, in most cases, being preferable. If the soil is good, but little manure is required. In highly enriched soil the plants are more liable to disease than when grown in soil that is naturally good. The best fertilizers are those of a dry, or absorbent nature. Plant as early in Spring as the ground can be had in fair working order, in hills or ridges about 6 feet apart, covering in light, warm soil, about 4 inches deep, but in cold, wet situations, 2 or 3 inches will be sufficient.

prevents it from being cut with the frost, but in sheltered fields

**GERMAN LIEBESAPEL, ITALIAN POMODORO, POLISH POMIDOR**

One ounce will produce about 1200 plants.

This delicious vegetable is one of the most important of all garden products. The seed should be sown in a hot-bed, about the first of March, in drills five inches apart and half an inch deep. When the plants are about two inches high they should be set out four to five inches apart, in another hot-bed, or removed into small pots, allowing a single plant to a pot. They are sometimes transplanted a second time into larger pots, by which process the plants are rendered more sturdy and branching. About the middle of May the plants may be set in the open ground. They are planted for early crops on light, sandy soil, at a distance of three feet apart, in hills in which a good shovelful of rotted manure has been mixed. On heavy soils, which are not suited for an early crop, they should be planted four feet apart. Water freely at the time of transplanting and shelter from the sun for a few days until the plants are established. Sufficient plants for a small garden may be started by sowing a few seeds in a shallow box or flower-pot and placing it in a sunny window of the room or kitchen.

Mulford Cultures

FOR LEGUMES

Increase Your Crops—Improve Your Soil

To get the best returns from your legume crops, inoculate the seed with Mulford Cultures. They increase the yield and improve the quality. More nitrogen is drawn from the air by inoculated legumes than is used by the plant itself, thus they add nitrogen and humus to the soil for the benefit of the succeeding grain crops.

To maintain soil fertility every crop rotation should include legumes. Up-to-date farmers use inoculation. The best are Mulford Cultures.

The date on the package is your protection.

When ordering always state kind of seed you wish to inoculate.

SEED DISINFECTANTS

Control Seed-borne Diseases of Farm Crops
Stimulate Germination - Improve Stands
Generally Produce Increased Yields of Higher Quality

CERESAN

for seed treatment of small grains

Ceresan has proven effective in controlling such seed-borne diseases as bunt or stinking smut of wheat; stripe disease of barley; loose and covered smuts of barley and oats and covered kernel smut of sorghum. It is the only dust treatment which has successfully controlled these destructive grain diseases. Ceresan does not injure the seed nor the grain drill. Only 2 oz. of Ceresan required per bushel of wheat, rye or sorghum and 3 oz. for barley and oats. Easy to apply, economical to use.

SEMESAN BEL

for seed white and sweet potatoes

Simply mix, dip, drain, dry and your seed potatoes are ready for planting. Semesan Bel may be used on either whole or cut seed pieces. Semesan Bel effectively controls such seed-borne disease organisms as scab, rhizoctonia and black-leg. By controlling these diseases, germination is generally increased, stand improved and the resultant crop bigger and of better quality. One pound treats 16 to 20 bushels of seed. Du Bay Semesan succeeds the products sold as Du Pont Semesan Bel and Bayer Dipdust.

SEMESAN JR.

for seed field and sweet corn

Semesan Jr. is especially effective in controlling seed-borne infections of diplodia, Gibberella and Basi sporium, without harming the seed embryo in the least. Its use protects the seed from rotting in the ground and makes possible earlier planting which generally results in increased yields. Improved germination, better stands, control of certain diseases, increased yields are the benefits which thousands of farmers are reaping, at a cost of less than 3c. an acre. Succeeds the products sold as Du Pont Semesan Jr. and Bayer Dust.

SEMESAN

for flower and vegetable seeds

Semesan may be applied in dust or liquid form to the seed before planting. It is harmless to the seed but deadly to disease organisms that may be on the seed. Semesan is such a powerful and effective disinfectant that seed treatment with it is ridiculously low in cost, ranging from 1/4c. to 1c. per pound of seed. One ounce treats 15 lbs. of seed. Effective in controlling damping off and such devastating gladiolus diseases as hard rot and scab. Du Bay Semesan succeeds the products sold as Du Pont Semesan and Bayer Uspulan.

### VEGETABLE SEED TABLE

Please note that the figures given in this table are subject to certain changes under varying conditions of growth, harvest and storage. They will also vary somewhat according to variety. In giving this table we naturally subject ourselves to certain criticism, especially on the part of the seed trade. We believe, however, that it is information which, on many occasions, will prove valuable to our customers and for this reason it is cheerfully given.

HAVE YOU A SINGING BIRD IN YOUR HOME?

Our Bird and Pet Department is several times larger than it could be in the old store. Sometimes there are hundreds of birds ready for delivery. And these come from all parts of the world.

Your favorite sort is always likely to be here, and what can add so much brightness, life or gaiety to a room as a bright-plumaged songster? The children, as well as adults, like them.

SOMETHING AS TO VARIETY

Canaries always—from the famous Hertz Mountains, Germany and from England. Choppers and Warblers also. Females especially selected for breeding purposes.

OUR ASSORTMENT OF BIRD CAGES IS LARGER

We show new shapes, too, which are proving exceptionally popular. New colorings are introduced in them, which harmonize with your room’s color scheme.

We have hundreds to choose from in scores of designs and colors. Stands are in equally large assortment.

THE STOCK OF GOLD FISH ENLARGED

All sizes and sorts in these lively little pets, too. Telescopes and Fantails, and other sorts that never grow out of date, it seems.

As to Aquariums, there’s improvement here, as well. New shapes—ovals, among them—and the round ones, squares and oblongs, as usual.

In Aquarium accessories there’s added interest and variety. More sorts than we used to carry, all adding interest to the aquariums in which they’re placed.

Come in any time to watch the little fish, or do your selecting at your leisure.
